

AWS IAM USER USING TERRAFORM

This project automates the deployment of enterprise AWS IAM infrastructure by utilizing a local CSV file as a decoupled source of truth. Leveraging Terraform's native `csvdecode()` and `file()` functions, the pipeline reads human-managed user data to dynamically provision 26 IAM user identities with custom resource tags and enforced initial console password resets. Using advanced conditional looping logic, users are automatically sorted into functional groups such as Education and Managers based on their specific department and job title attributes.

Step 1: Prepare the Local Dataset

```
1 first_name,last_name,department,job_title
2 Michael,Scott,Education,Regional Manager
3 Dwight,Schrute,Sales,Assistant to the Regional Manager
4 Jim,Halpert,Sales,Sales Representative
5 Pam,Beesly,Reception,Receptionist
6 Ryan,Howard,Temp,Temp
7 Andy,Bernard,Sales,Sales Representative
8 Robert,California,Corporate,CEO
9 Stanley,Hudson,Sales,Sales Representative
10 Kevin,Malone,Accounting,Accountant
11 Angela,Martin,Accounting,Accountant
12 Oscar,Martinez,Accounting,Accountant
13 Phyllis,Vance,Sales,Sales Representative
14 Toby,Flenderson,HR,HR Representative
15 Kelly,Kapoor,Customer Service,Customer Service Representative
16 Darryl,Philbin,Warehouse,Warehouse
17 Creed,Bratton,Quality Assurance,Quality Assurance
18 Meredith,Palmer,Supplier Relations,Supplier Relations
19 Erin,Hannon,Reception,Receptionist
20 Gabe,Lewis,Corporate,Coordinating Director of Emerging Regions
```

Step 2: Configure the S3 State Storage Folder

Step 3: Initialize the Directory

Terraform init

Step 4: Parse Data and Review the Plan

Terraform plan

Step 5: Apply the Configuration

BY applying: terraform apply

Step 6: AWS Management Console Verification

A. Identity Layer Overview

B. User Groups Sorting

DONT FORGET TO: Terraform destroy or the bill might destroy you, lol.
